Continuum model for gas transport

- Variables: O_2 , CO_2 and N_2
- Transport: diffusion + permeation
- Enzyme kinetics: Michaelis-Menten
- Geometry: based CT images

$$flux = D_{O_2} \frac{\Delta C_{O_2}}{L} \Rightarrow D_{O_2} = flux \frac{L}{\Delta C_{O_2}}$$

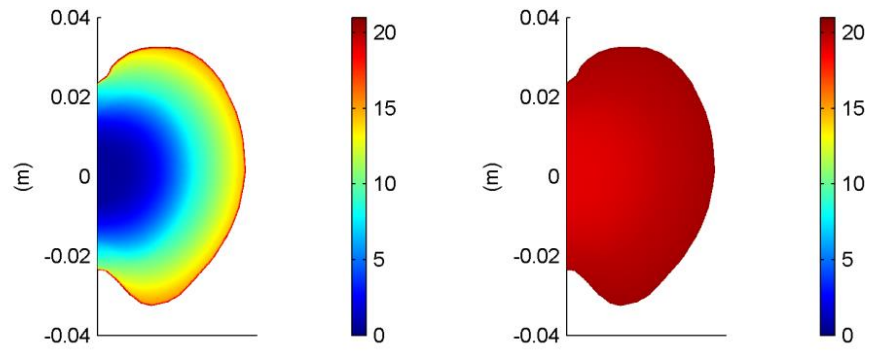

O₂ partial pressure

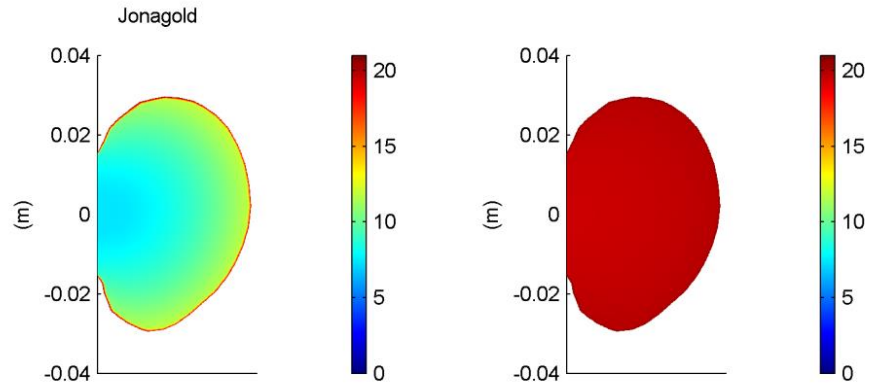

CO₂ partial pressure

Braeburn

Limitations of continuum approach

- Fit reasonable but not perfect
- *Apparent* model parameters
- Simulations do not provide direct information about gas related disorders

 **Multiscale model**

Multiscale modelling

$$flux = D_{O_2} \frac{\Delta C_{O_2}}{L} \Rightarrow D_{O_2} = flux \frac{L}{\Delta C_{O_2}}$$

Process design

- Tissue diffusivity

Process design

- Tissue respiration

- Monte Carlo simulations

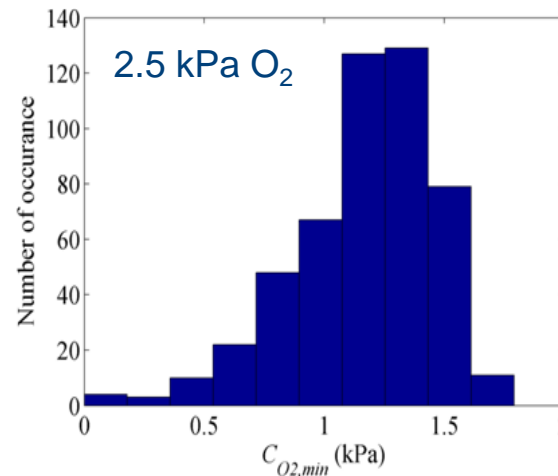

- Minimum oxygen concentration in fruit

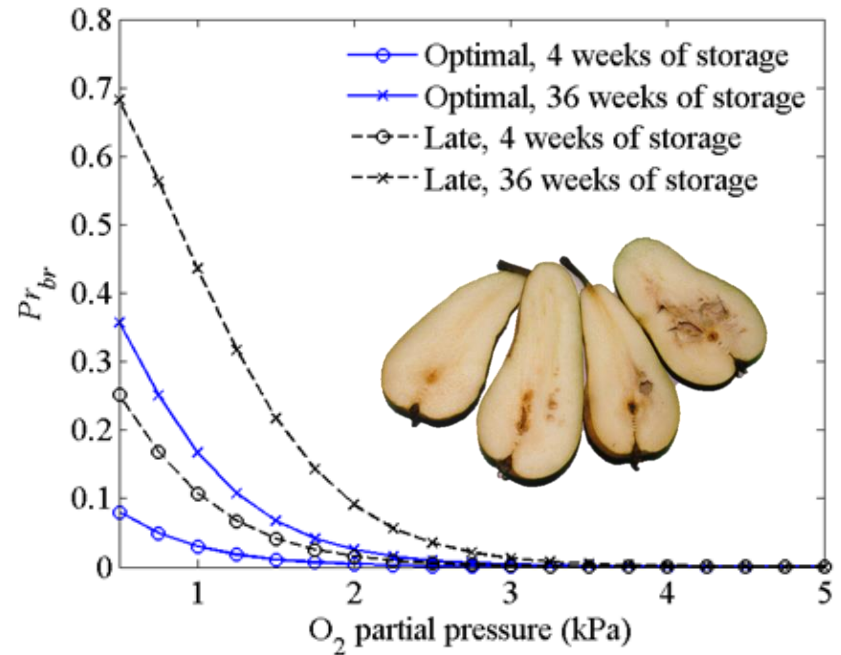

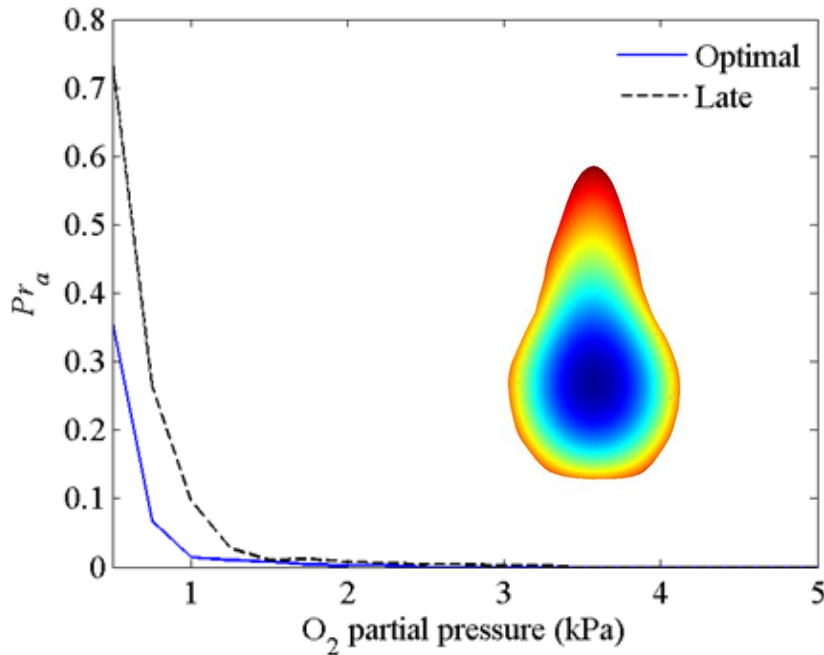

Optimal
picking

Late
picking

- Probability of fermentation agrees with probability of browning disorder

Verlinden et al. (2002) Biosystems Eng

Conclusions

- Porous structure of fruit determines gas exchange
- A stochastic multiscale diffusion-reaction model
 - Predicts critical oxygen levels for development of disorders
 - Fruit size and maturity affect gas concentrations within the fruit the most
- Initiated novel storage techniques such as dynamic controlled atmosphere (RQ-DCA)
